

FINANCIAL PROCESSING SYSTEMS AND METHODS

ABSTRACT OF THE DISCLOSURE

A database system that can analyze multichannel data multilaterally so as to total data items and satisfy various detailed conditions. The system includes: a data storage unit 5 50 for storing data; a data base management unit for managing input/output of data to/from this data storage unit; a data processor for controlling the data base management unit to obtain predetermined data from the data storage unit and process the data; and a stored function 40 enabled to define a field value used to group data. The data processor is used to enter an execution command that specifies the stored function to be used in a data processing so as to instruct the data base management unit to total data items according to the 15 field value defined by the stored function specified in the execution command.
